

ICT1242 – Computer Architecture

1. Suppose an 8-bit data word stored in the memory is 11000010.
 - i. Using Hamming algorithm, Determine the check bits
 - ii. If the check bits calculated by the word which was read from memory are 0111, then find the word which was read from the memory

2. i. Calculate the control bits for the given word 1001 and fill the following table.

Bit Position	7	6	5	4	3	2	1
Position number							
Data bits							
Control bits							

- ii. Illustrate the above data bits and control bits in a Venn diagram.
